**Problem 22.** If  $f: A \to B$  has an inverse function then f is onto and f is one-to-one.

*Proof.* Suppose  $f: A \to B$  has an inverse function  $g: B \to A$ . By definition of an inverse function this means that

$$g(f(a)) = a$$
, for all  $a \in A$   
 $f(g(b)) = b$ , for all  $b \in B$ 

**one-to-one**: Let  $a_1, a_2 \in A$  such that  $f(a_1) = f(a_2)$ . To prove f is one-to-one(injective) we must show that  $a_1 = a_2$ . Observe that composing the inverse g with f gives

$$g(f(a_1) = g(f(a_2))$$

As a result of applying the definition of inverse g(f(a)) = a, we get

$$a_1 = a_2$$

Therefore f is injective.

**onto :** To prove that f is onto, we must show that there exists an  $a \in A$  such that f(a) = b. Since  $g : B \to A$ , we know that  $g(b) \in A$ . Let a = g(b). Substituting a in f(a) gives

$$f(a) = f(q(b)) = b$$

As a result of applying the definition of inverse f(g(b)) = b. Therefore, for every  $b \in B$ , there exists  $a = g(b) \in A$  such that f(a) = b. Hence f is onto.

Since f is both one-to-one and onto, it follows that f is bijective.  $\Box$ 

**Problem 23.** A real number  $x \in \mathbb{R}$  is called algebraic if there exists  $a_0, a_1, \ldots, a_{n-1}, a_n \in \mathbb{Z}$ , not all zero, so that

$$a_n x^n + a_{n-1} x^{n-1} + \dots + a_1 x + a_0 = 0$$

That is, a real number is algebraic if it is a root of a polynomial equation with integer coefficients.

(a) The numbers  $\sqrt{2}$ ,  $\sqrt[3]{2}$ , and  $\sqrt{3} + \sqrt{2}$  are algebraic. For  $\sqrt{2}$ :

*Proof.* Let  $p(x) = x^2 - 2$ . We verify that  $\sqrt{2}$  is a root of this polynomial:

$$p(\sqrt{2}) = (\sqrt{2})^2 - 2 = 2 - 2 = 0$$

Thus  $\sqrt{2}$  is algebraic.

*For*  $\sqrt[3]{2}$  :

*Proof.* Let  $p(x) = x^3 - 2$ . We verify that  $\sqrt[3]{2}$  is a root of this polynomial:

$$p(\sqrt[3]{2}) = (\sqrt[3]{2})^3 - 2 = 2 - 2 = 0$$

Therefore  $\sqrt[3]{2}$  is algebraic.

*For*  $\sqrt{3} + \sqrt{2}$ :

*Proof.* Let  $p(x) = x^4 - 10x^2 + 1$ . We verify that  $\sqrt{3} + \sqrt{2}$  is a root of this polynomial:

$$p(\sqrt{3} + \sqrt{2}) = (\sqrt{3} + \sqrt{2})^4 - 10(\sqrt{3} + \sqrt{2})^2 + 1$$

$$= (3 + 2\sqrt{6} + 2)^2 - 10(3 + 2\sqrt{6} + 2) + 1$$

$$= (5 + 2\sqrt{6})^2 - 30 - 20\sqrt{6} - 20 + 1$$

$$= 25 + 20\sqrt{6} + 24 - 30 - 20\sqrt{6} - 20 + 1$$

$$= 50 + 20\sqrt{6} - 50 - 20\sqrt{6}$$

$$= 0$$

Thus  $\sqrt{3} + \sqrt{2}$  is algebraic.

(b) For fixed  $n \in \mathbb{N}$ , let  $A_n$  be the set of algebraic numbers which are roots of polynomials, with integer coefficients, of degree n. Then  $A_n$  is countable.

*Proof.* A polynomial of degree n with integer coefficients is defined as

$$a_n x^n + a_{n-1} x^{n-1} + \dots + a_1 x + a_0 = 0$$

where  $a_i \in \mathbb{Z}$  and  $a_n \neq 0$ .

(c) The set of all algebraic numbers is countable.

**Problem 24.** There is an onto function  $f:(0,1) \to S$  where  $S = \{(x,y): 0 < x, y < 1\}$  is the unit square in the plane  $\mathbb{R}^2$ .

*Proof.* 
$$\Box$$

**Problem 25.** (a)  $\lim_{n \to \infty} \frac{2n+1}{5n+3} = \frac{2}{5}$ 

*Proof.* Let 
$$\epsilon > 0$$
.

(b) 
$$\lim_{n \to \infty} \frac{2n^2}{n^3 + 1} = 0$$

*Proof.* Let  $\epsilon > 0$ . (c)  $\lim_{n \to \infty} \frac{\sin(n)}{\sqrt{n}} = o$ *Proof.* Let  $\epsilon > 0$ . (a) A sequence with an infinite number of ones that does not converge to Problem 26. one. (b) A sequence with an infinite number of ones that converges to a limit not equal to one. **Problem 27.** Let  $(x_n)$  be a sequence that converges to x. Suppose p(x) is a polynomial. Then  $\lim_{n \to \infty} p(x_n) = p(x).$ Proof. **Problem 28.** Consider three sequences  $(x_n)$ ,  $(y_n)$ , and  $(z_n)$  for which  $x_n \leq y_n \leq z_n$  for each n. If  $x_n \to \ell$  and  $z_n \to \ell$  then  $y_n \to \ell$ .

Proof.
